$$n-p$$
 system: 
$$\frac{^{2S+1}L_{J}}{^{isospin}}$$

Capture is M1:  ${}^{1}S_{0}$  to spin-1 deuteron  ${}^{3}S_{1}$  (ignoring D-state contributions).

Parity violation arises from mixing of P states and interference of the E1 transitions.

 $A_{\gamma}$  cannot come from J=0 capture states, so it must come from  ${}^{3}S_{1}$  -  ${}^{3}P_{1}$  mixing.

Therefore  $A_{\gamma}$  results from  $\Delta I = 1$  terms in the weak Hamiltonian.
